

This slideshow contains all of the images created from data set 18B-229. There are a total of 43 complete, undistorted, images stored here, each with two different sizes shown.

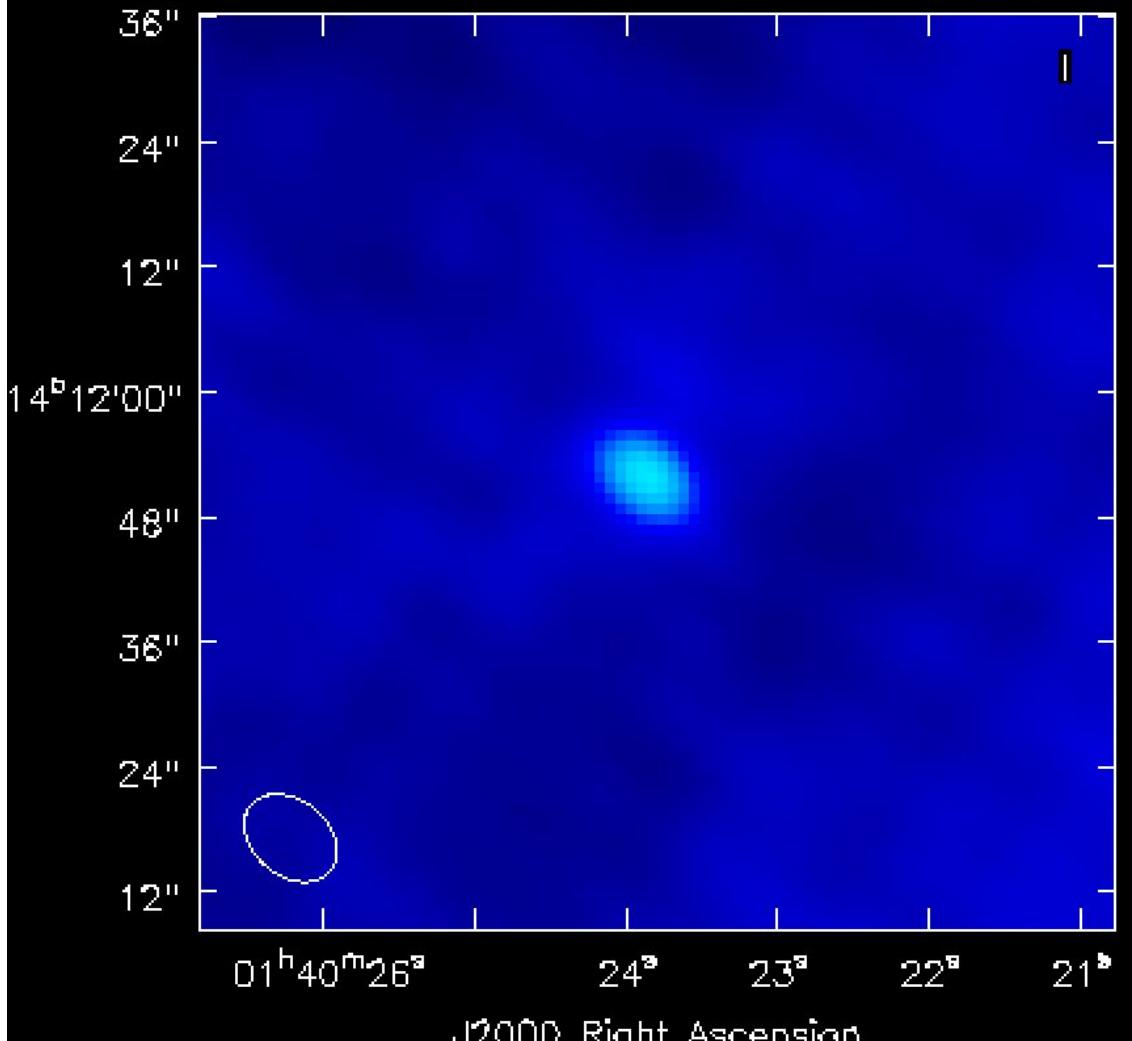

For each observation, the first image shown has dimensions of 4.5arcmin x 4.5arcmin, giving a wide enough field of view to see any possible lobes/other sources associated with the target (also the same dimensions of default FIRST cutout), and the second is zoomed in to give dimensions of 90arcsec x 90arcsec.

Images are ordered by their calculated luminosities and separated by whether or not they were determined to be detections or a possible detection of our target. The name of each observation is displayed as part of the screenshot right above the image.
